Reaching those web folk

Christian Heilmann | http://scriptingenabled.org

National Maritime Museum, London, UK, April 2009

The internet is a media.

It is highly distributed, available 24/7 and easy to be a part of.

And my god is it huge.

The sheer size of the internet makes it hard to be found and to get your content out to people.

Which is why people spend more time on optimising their products for search engines than for their end users.

To have success in reaching people on the web, we have to re-think some ideas.

In the old school model, you build a site and people come.

Reader + User Reader + User

Reader + User Reader + User This works to some degree, but only really when you are a starting point of the web experience (ISP, news portal...)

For normal web sites, much more visitors come to your site in a roundabout way.

Your
Site

Search Engines Partner Sites Paid Links Social Media

Lots of arrows here...

Reader + User Reader + User Reader + User

Reader + User Reader + User Reader + User Reader + User

To make this work on a much bigger scale, re-think the web.

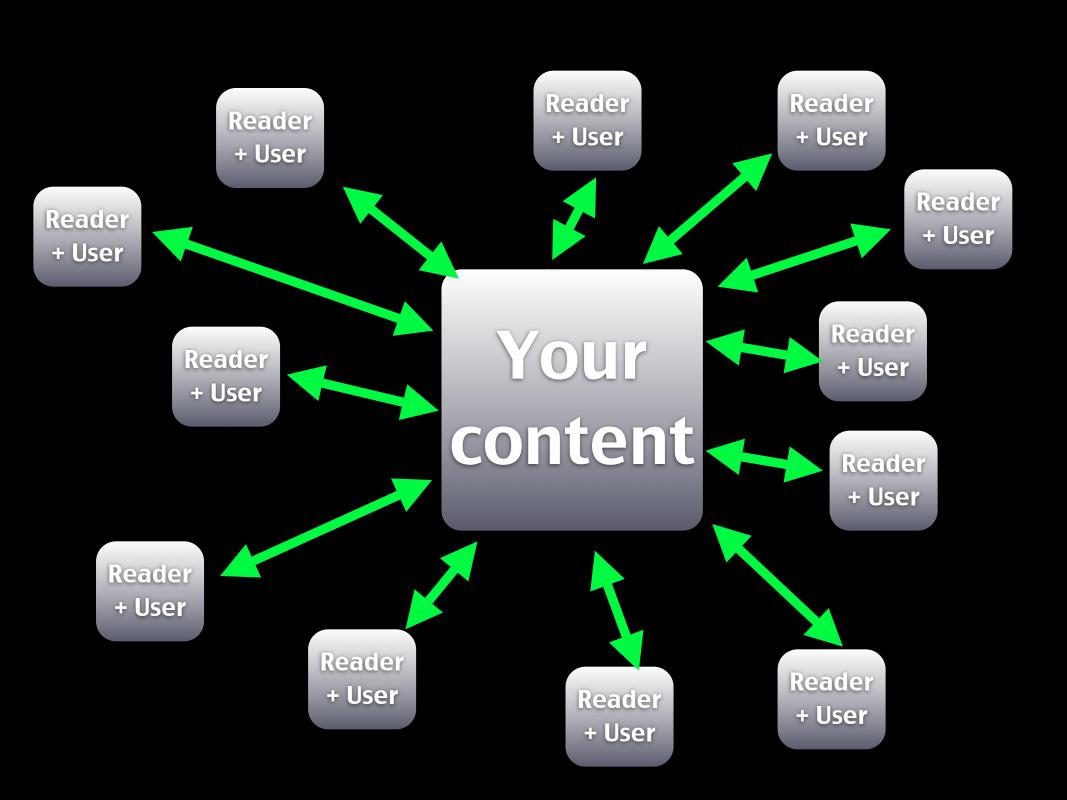

The web is *not* a broadcasting media with receivers.

Every receiver is also a broadcaster.

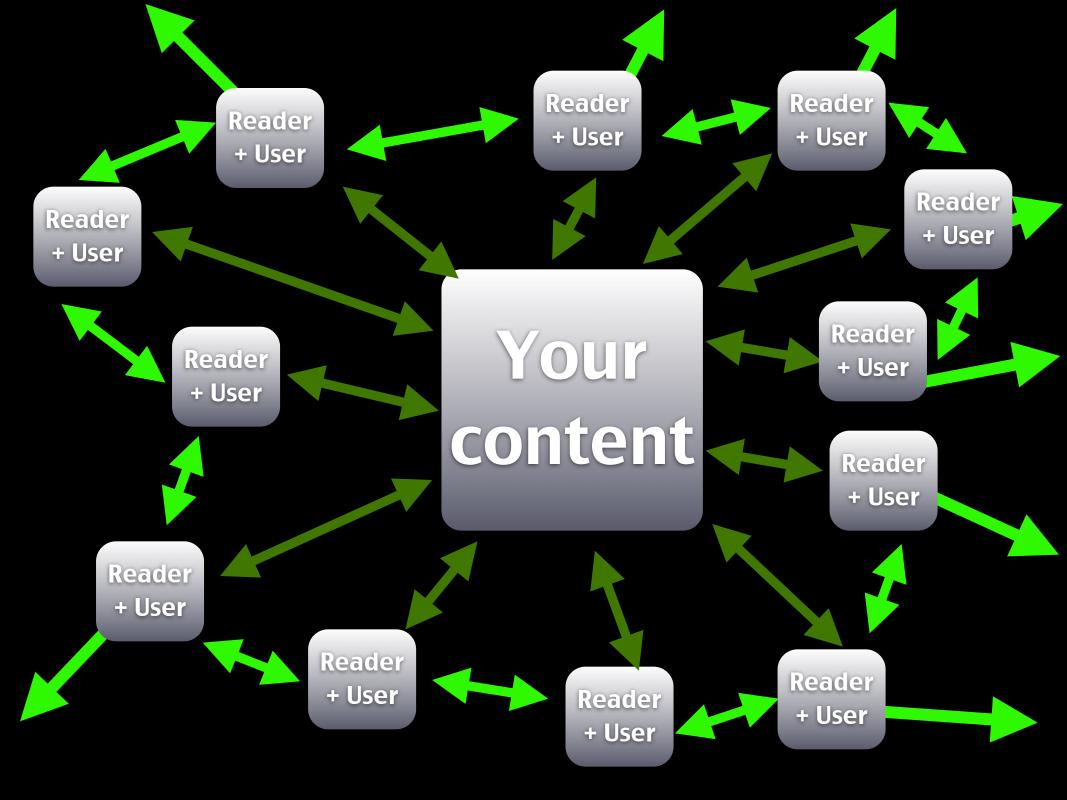

Starting a blog, signing up for twitter, uploading photos to flickr...

All of these things are terribly easy.

If you re-think your site as your content, then any of these broadcasting stations can be a relay for your message.

And they talk to yet other people and have access to other distribution channels you aren't even aware off.

You validate content on the web with links and quoting from other sources.

People add their own opinion and allow for others to give theirs.

People also mix your information with other sources to prove a point or validate it.

Much like good journalism works – only on a wider, media richer and less professional scale.

The power of this distribution is very much obvious if you ever try to pull something from the web. :-)

So how can you be part of this?

Make your content easy to access.

This starts by structuring your web sites in a semantic manner.

Continues with adding more semantic richness with RDF and microformats.

Gets even easier by providing data feeds in Atom or RSS.

And ends with the rolls royce of distribution: your own API.

Semantic document structure, RDF and microformats are useful for other machines to make sense of your content.

Especially search engines love them.

One thing that made this much more obvious to me was when Yahoo opened their index as an API.

Yahoo! Search BOSS

BOSS (Build your Own Search Service) is Yahoo!'s open search web services platform. The goal of BOSS is simple: to foster innovation in the search industry. Developers, start- ups, and large Internet companies can use BOSS to build and launch web-scale search products that utilize the entire Yahoo! Search index. BOSS gives you access to Yahoo!'s investments in crawling and indexing, ranking and relevancy algorithms, and powerful infrastructure. By combining your unique assets and ideas with our search technology assets, BOSS is a platform for the next generation of search innovation, serving hundreds of millions of users across the Web.

How Do I Get Started?

- 1. Check out BOSS specs and mash-up examples below
- 2. Review the documentation
- 3. Get a BOSS Application ID

http://developer.yahoo.com/search/boss/sa-pa

OVERVIEW

Search APIs are nothing new, but typically they've included rate limits, strict terms of service regarding the re-ordering and presentation of results, and provided little or no opportunity for monetization. These constraints have limited the innovation and commercial viability of new search solutions.

Another thing BOSS does right now is provide a mainstream channel for the semantic web and Microformats.

Using SearchMonkey technology **BOSS lists this** information in the results.

view=searchmonkey_feed

view=searchmonkey_rdf

http://developer.yahoo.com/search/boss/ structureddata.html

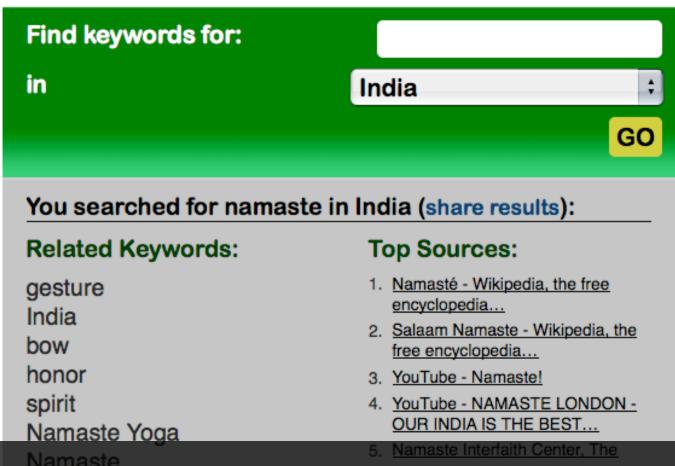

Another interesting thing is the keyterms parameter in BOSS.

This one returns the keywords people entered to find a web site.

Keywordfinder - find related keywords for any search

Keywordfinder helps you discover very successful keywords for any topic you enter. This allows you to write page copy that makes it much easier for people on the web to find your content.

Simply enter a topic in the following search box, hit "Go" and we will provide you with the 20 most successful keywords related to your topic and the top web sites to compare yours with.

How does Keywordfinder work?

Is it free?

Suggestions

This gives search engines access (and also hard core developers).

But you can make it even easier.

Your data is already available on the web.

And if it is interesting enough, people will try to get to it and remix it.

Let's say I want to display the opening hours of the V&A on my tourism tips site for London.

```
<?php-
$url = "http://www.vam.ac.uk/your_visit/opening/index.html";
$ch = curl_init(); -
curl_setopt($ch, CURLOPT_URL, $url); -
curl_setopt($ch, CURLOPT_RETURNTRANSFER, 1); -
$output = curl_exec($ch); -
curl_close($ch);-
$output = preg_replace("/\r|\n/",'',$output);-
$output = preg_replace("/^.*<h1/",'<h1',$output);-</pre>
$output = preg_replace("/<div class=\"clear\"</pre>
id=\"sub_navigation\">.*$/",'',$output);-
                                                                Opening Times
echo $output;-
                                                                Museum Opening Hours
                                                                0.00 to 22.00 Fridays (selected galleries remain open after 18.00.)
?>¬
                                                                losed 24, 25 & 26 Decemb
                                                                The tunnel entrance to the V&A is open from 10.00 - 17.30 daily but may be closed, on occasion, on the advice of London Underground
                                                                Museums at Night

Valentine's in Verona

Wed, Jan 14, 2009 12:36

For a romantic Valentine's Day voyage it is difficult to find a more seductive destination than the Italian city of Verona. Famous for inspiring William Shakespeare to write Romeo and Juliet, there is a lot more to discover here than that balcony. Here are 10 romantic ideas

1. Verona in love

Each year around 14 February, the city organises a series of romantic events entitled <u>Verona in Love</u>. Not surprisingly, you can't really escape Romeo and Juliet, with guided tours following in the footsteps of the star-crossed lovers and an award for the best love-letter sent to Juliet. But there are also restaurants offering candle-lit dinners, art exhibitions and poetry readings, plus a series of free early evening concerts ranging from classical recitals and chamber music, to local bands performing salsa, reggae and ragamuffin. It is worth noting that just after Valentine's Day, celebrations for the 2009 Carnival season begin, and although Verona can't compare with Venice, there is a big masked parade here on 20 February, followed by a sumptuous Regata Storica on the Adige river the next day.

2. Verona Arena

This ancient Roman amphitheatre dates back to AD 30, and dominates the centre of the city. Be warned that if you pose with the actors dressed up as gladiators at the entrance they'll expect to be paid, but once inside, the sheer size and grandeur of the arena is quite breathtaking, with far less crowds and queues than Rome's Colosseum. And you may well want to return here in summer during the famous Opera festival, for the unforgettable experience of watching a magical performance of Aida, The Barber of Seville or Tosca under a starlit sky.

http://www.guardian.co.uk/travel/restaurants/rss

This <u>luxury boutique noted</u> has just opened up right inside the courtyard of the palace where lovers come to marvel at juliet's mythical balcony. It has to be the ultimate place to splash out for someone looking to pop the question or celebrate an anniversary. Naturally, it

And they took the next steps of providing APIs to end users to filter down the data to exactly what they need.

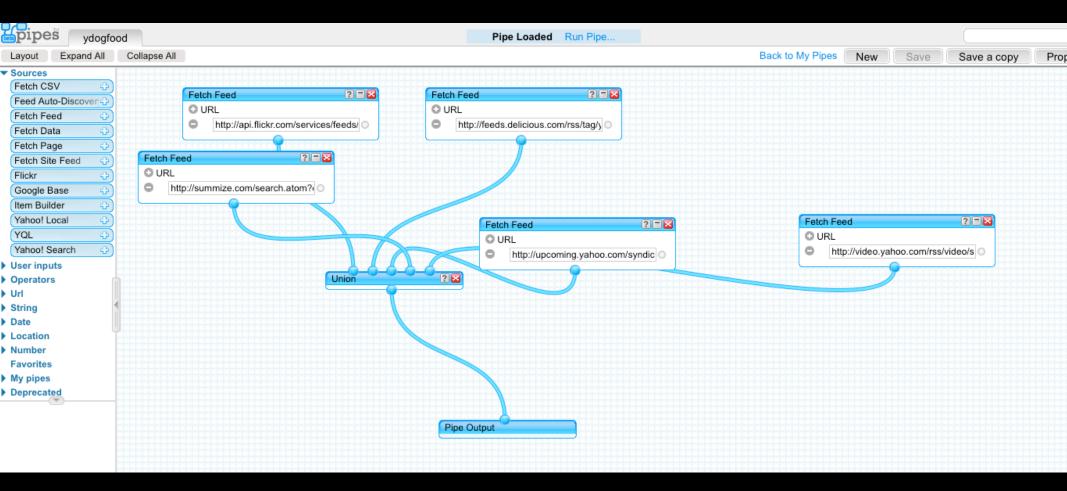

So now developers have access to all kind of data out on the web to mix and match.

And they build blog plugins, Facebook applications and other widgets and distribution channels for our data.

The problem is that the more data sources you use, the more time you spend on reading API documentation.

The other problem is that the more sources you connect to, the more chances of error are there.

What we needed are systems to aggregate several sources painlessly.

http://pipes.yahoo.com

Pipes allows you to get user input, get data from web resources, put them all together and get them back as XML, JSON and other formats.

The drawback of pipes is that it is a visual interface and changes have to be made by hand.

You can't just quickly use a pipe in your code and alter it on the fly.

Which is one of the reasons for a new system with a different angle: YQL.

YQL is a SQL-style interface to all Yahoo data – and the web!

Say you want to get photos of London that you are allowed to show in your own products.

You need to define London without a doubt.

select woeid from geo.places where text='London,uk'

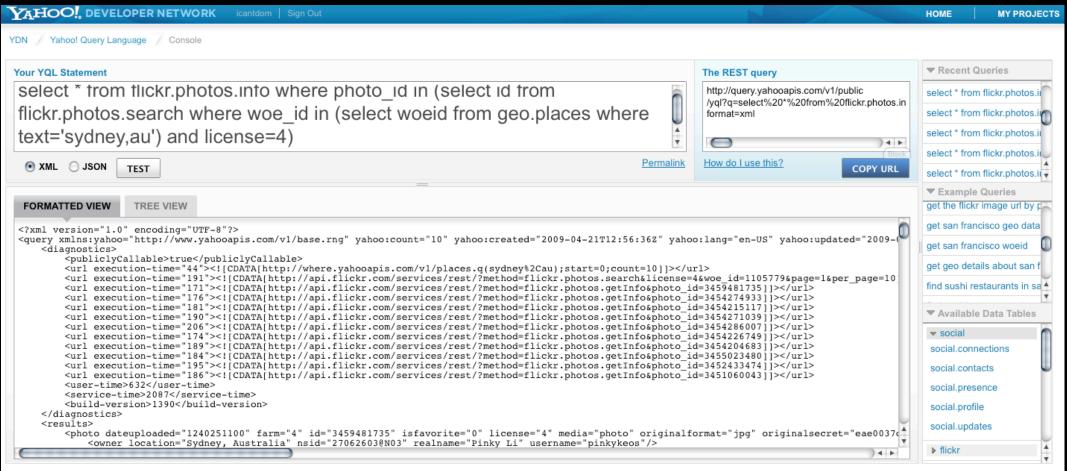

Then find photos that were taken there.

select id from flickr.photos.search where woe_id in (select woeid from geo.places where text='london,uk')

Check that they have the right license.

And get all the information about them.

select * from flickr.photos.info
where photo_id in (select id from
flickr.photos.search where woe_id in
(select woeid from geo.places where
text='london,uk') and license=4)

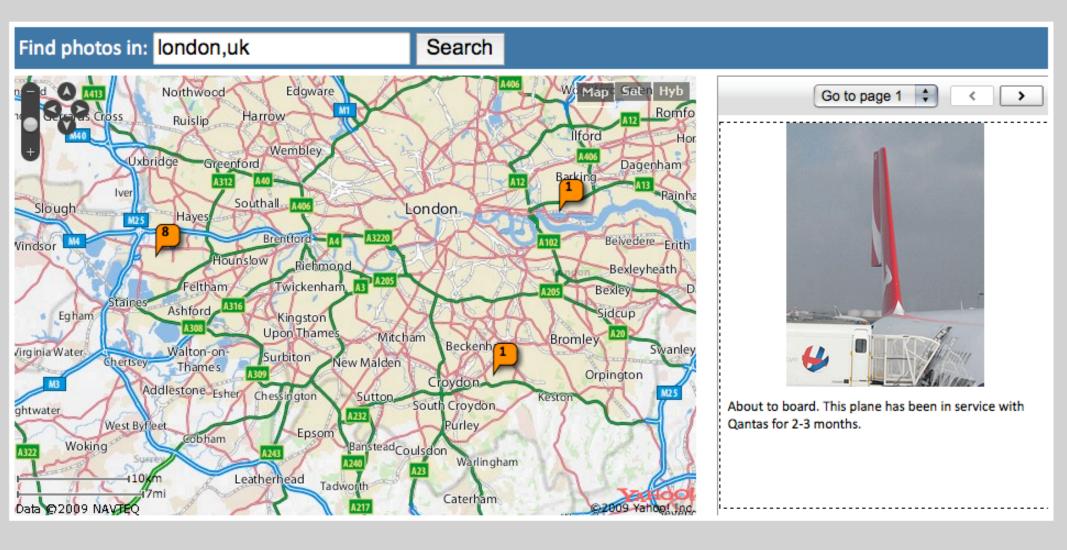

Version 1.0 | Copyright © 2008 Yahoo! Inc. All rights reserved. Copyright | Privacy Policy | Forum

http://developer.yahoo.com/yql

http://developer.yahoo.com/yql/console/?q=select%20*%20from %20flickr.photos.info%20where%20photo_id%20in%20(select%20id%20from %20flickr.photos.search%20where%20woe_id%20in%20(select%20woeid %20from%20geo.places%20where%20text%3D%27london%2Cuk%27)%20and %20license%3D4)

Then you can build a nice interface and show that data.

Geo Location powered image search with YQL and Flickr

Written by Christian Heilmann, powered by YUI, YQL, Flickr and Yahoo Maps

http://isithackday.com/hacks/cantine/index.php?loc=london%2Cuk

All without having to spend hours on reading either the Flickr or the GeoPlanet API docs:)

This also helps us immensely internally – as we have varying APIs in all departments.

YQL gives you access to the Yahoo services and to any data source on the web – including HTML and microformats.

Now here's the really good news:

You can easily add your information to YQL via something we call "Open Tables".

Take young Jim O'Donnell of the National Maritime Museum in London.

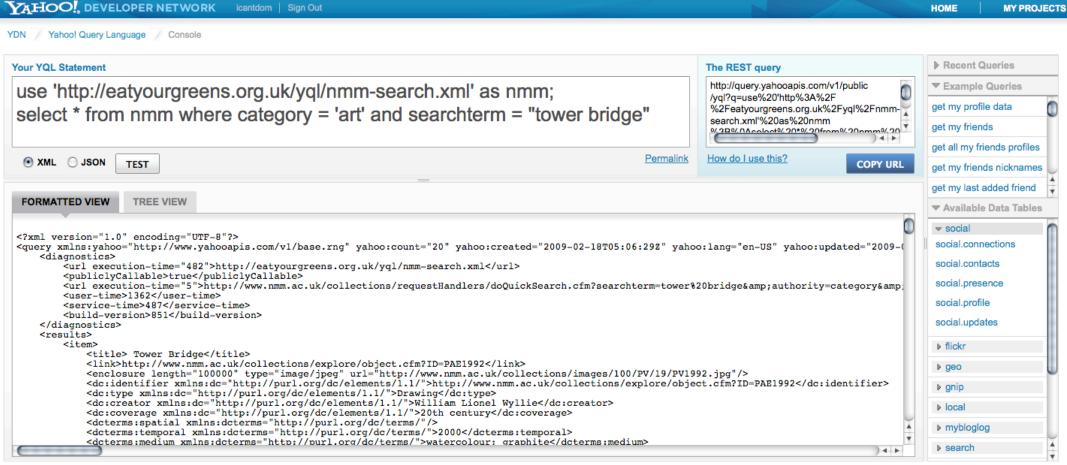

They are already part of the Commons on flickr:

http://www.flickr.com/people/nationalmaritimemuseum/

He wanted to allow people to access their free data and filter it without providing an API.

All it needed was a simple XML file.

```
<?xml version="1.0"?>
<meta>
   <author>Jim O'Donnell</author>
   <documentationURL>http://www.nmm.ac.uk/collections/</documentationURL>
 </meta>
 <br/>
<br/>
dings>
   <select produces="XML" itemPath="rss.channel.item">
     <urls>
       <url>http://www.nmm.ac.uk/collections/requestHandlers/
doQuickSearch.cfm?
searchterm={searchterm}&authority={authority}&category={category}&
amp;startrow=1&format=rss</url>
     </urls>
     <inputs>
       <key id="searchterm" type="xs:string" paramType="path"</pre>
required="true"/>
       <key id="authority" type="xs:string" paramType="path"</pre>
required="false" default="category"/>
       <key id="category" type="xs:string" paramType="path"</pre>
required="false" default=""/>
   http://developer.yahoo.com/yql/guide/yql-
   </select>
                opentables-chapter.html
 </bindings>
```

Version 1.0 | Copyright © 2008 Yahoo! Inc. All rights reserved. Copyright | Privacy Policy

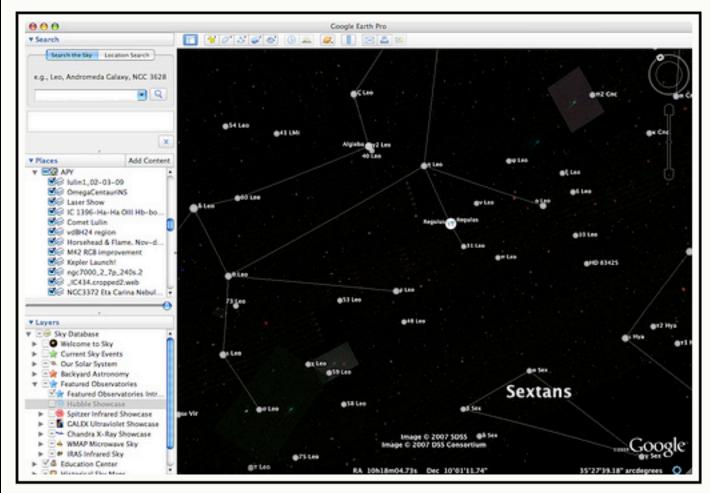

http://developer.yahoo.com/yql/console/?q=use%20%27http%3A%2F %2Featyourgreens.org.uk%2Fyql%2Fnmm-search.xml%27%20as%20nmm%3B <u>%0Aselect%20*%20from%20nmm%20where%20category%20%3D%20%27art</u> %27%20and%20searchterm%20%3D%20%22tower%20bridge%22

This was a start, now he is going nuts with it...

Jimbo

Machine tags and Google Sky, originally uploaded by eat your greens.

Astronomy photographer of the year has been open for a couple of months now, and the astrophoto Flickr group has a few hundred photos now. The amazing astrometry.net bot has been scanning the group and about 70 photos have been tagged with their celestial coordinates, using astro: machine tags.

Read the rest of this entry »

Let's look at some of his stuff later...

In conclusion:

By opening your data to the web you make web users your data advocates.

You start by writing clean, semantic web sites.

You make it easier for people by providing data feeds.

You really go to town with your own API.

If you can't do that, a YQL open data table pointing to a search engine on your site also works.

YQL handles the interface, caching and data conversion for you.

YQL also limits the access to sensible levels.

It works for us, it can work for you.

THANKS!
